

Student Id: 2329860

Name: Karan Sah

Module: Object Oriented Design and Programming

Course Management System

UML Diagram

Explanation:

The coursework was to make a course management system which was done through Java using GUI programming/ swing and JDBC using php. The first coursework package was created to include all the other files that were vital to the system. A user is directed to the login page first where they fill out the necessary information to log in. There also is a register page for those whose information is already not in the database and they are directed to the register page. Then the user is directed towards their respective dashboard (admin dashboard if they are admin, teacher if they are teacher, and student if they are student). This is defined by the combo box which has the option to select from three users.

Admin has the right and access to delete, add, update, or deactivate courses. Likewise, it is possible to add, update, or delete students and teachers in the system. They are also responsible for generating academic reports of students if required. Teachers can add and update reports and have the right to view other students and teachers. Finally, the student can view their modules, select their courses, and

can also see the respective teachers that are assigned to the respective modules, and can also view their report cards.
