

1. What are the most challenging aspect of the coursework task?

The most challenging aspect of this coursework would have been implementing the logic through the means of code. Other were codes to fulfill all the functions as there were a lot of functions to implement which included many functions like winning, which included a draw, and having invalid moves. Another challenging aspects were of how to implement menus and leaderboard. Although menu implementation were easier compared but the leaderboard options were a bit difficult as there were the requirements of reading, writing and also to keep track for multiple players. Also, at first many different errors would pop up too. There were also requirements for pylint.

2. How did you go about completing the task?

First the understanding of requirements were a bit difficult and so I read carefully about the requirements and having functions of noughtsandcrosses and from codes of `play_game`. Then I had to plan the code and first try by myself and then I took references from youtube and other websites. Then I planned the codes like pseudocodes breaking down the codes as the code were relatively larger compared to anything I had done. Moreover, the testing and debugging of codes were a bit difficult as the errors would pop up quite often giving me quite the frustration but the joy after fixing the error was there too.

3. What have you learned over the course of completing this coursework task?

First, I understood the workings of noughts and crosses games and its codes in python. Likewise, my understanding of concepts of functions, data types, variables and control structures definitely improved.

Similarly, my thinking of codes, creativity and problem solving were improved. This experience greatly improved my python coding. This coursework also improved my debugging skills. This coursework overall improved my coding and how a code behind a game works.
